ABSTRACT

The standard mass emission test (Federal Test Procedure) was performed for emission factors determination on samples of passenger cars operating in each of Los Angeles, Houston, Denver, Phoenix, St. Louis and Washington D.C. These samples were also used for obtaining abbreviated emission test (short cycle test), fuel economy test, emission related maintenance and other data.

Two-thousand forty-two (2,042) vehicles were tested under the program: 200 in Los Angeles, 542 in Houston and 325 in each of the four other sites. Vehicles in the Los Angeles sample were from the 1978-1980 model years. These vehicles were tested to provide data on three-way catalysts, the technology with which each was equipped. Vehicles in the Houston sample were from the 1975-1980 model years. Vehicles in the Washington, D.C. sample were from the 1977-1980 model years. Vehicles in samples of the other three sites were from the 1975-1979 model years.

The FTP and the Highway Fuel Economy Test were performed on all vehicles at all sites. Evaporative emission tests by the Sealed Housing for Evaporative Determination (SHED) procedure were performed on some vehicles in the St. Louis and Denver sites. Short cycle tests performed at the various sites were comprised of one or more of the following: the 50 (mph) Cruise, the New York City Cycle, the Federal Short Cycle, the Two Speed Idle, the Four Speed Idle, the Federal Three Mode and the Two Mode Loaded tests.

Some vehicles which exceeded Federal standards (excluding the Houston site) were subjected to a restorative maintenance evaluation. The evaluation employed in Los Angeles was designed to address three-way catalyst technology.

Some vehicles in all but the Los Angeles site were used to evaluate commercial repair facility performance in relation to idle speed and mixture adjustments.

Other actions were taken in relation to each vehicle tested. These included an emission control system maladjustment/disablement and status inspection, driveability evaluations and owner interviews to obtain vehicle maintenance and useage data.

1. INTRODUCTION

The U. S. Environmental Protection Agency (EPA), under authority of the Clean Air Act, develops, implements and administers a program to assess, quantify and reduce pollution of the nation's resources. Authority for parts of this program is delegated to the agency's Emission Control Technology Division (ECTD). The ECTD's responsibility is to assess, quantify and reduce air pollution from in-use motor vehicles. Such responsibility includes that of designing, implementing and administering the Emission Factors Program.

The Emission Factors (EF) program consists of a series of annual studies designed to obtain data from in-use vehicles operated under a variety of topographical and climatological conditions. Vehicles subject to California's emission standards are included. Data obtained from these studies are used in calculating current and projecting future light-duty vehicle emission factors.

EF studies began in the EPA's Fiscal Year (FY) 1971. Subsequent studies were conducted in Fiscal Years 1972, 1973, 1974, 1975 and 1977. Extensions to the FY 75 and FY 77 programs precluded separate EF studies in each fiscal year following those in which these studies were initiated and by which they are identified. Vehicles have been tested annually with exceptions as indicated in either six or seven of the following U. S. cities: Chicago, Houston, Denver, Los Angeles, Detroit, Phoenix, St. Louis and Washington, D.C.

In the EF program's initial stages, vehicles of interest covered a relatively large number of the most current model years. The FY 71 program, for example, covered the 1957-1971 models, a span of fifteen model years. As more and more information was obtained from these studies, however, the model year span was reduced with each successive program year. Of late, the program has spanned five or six of the most recent model-years, depending on the testing site and the EPA's particular needs.

Program test procedures have also been changed as testing technology changed and new emission control technologies were introduced. The 1972 Federal Test Procedure, for example, was originally used for emission factors determination. This procedure was replaced, in time, by procedures applicable to the 1975 model year. The Sealed Housing for Evaporative Determination (SHED) came into use for determining fuel evaporative emission factors, as another example, as concern over this pollution source emerged. For determining modal emission factors, procedures of the EPA's Surveillance Driving Sequence and Steady State tests also came into use. Other tests used for emission factors included the EPA's Sulfate Emission Test and the low temperature version of the 1975 Federal Test Procedure.

The scope of EF study programs has also been expanded over the years. A somewhat recent inclusion is the collection of mass and direct tailpipe emission data by abbreviated test procedures. Abbreviated emission tests have come under consideration in recent years for use in state and local vehicle emission inspection and maintenance programs. Also included are investigations of the individual and combined effects of emission control system malfunction, disablement and maladjustment on vehicle emissions and fuel economy.

The next study in the program, the FY 79 Emission Factors study, is the subject of this report. To execute this study the EPA contracted with Automotive Testing Laboratories, Inc. (ATL) to provide data from vehicles operating in six of the study sites: Houston, Phoenix, Los Angeles, Denver, St. Louis and Washington, D.C.

2. TECHNICAL DISCUSSION

2.1 PROGRAM OBJECTIVE

The program's objective was that of obtaining emission test, fuel economy test, vehicle emission control system maintenance and other data from passenger cars operating in six U.S. metropolitan areas. These data are used in calculating and projecting light-duty vehicle emission factors and in satisfying other of the EPA's data needs.

2.2 PROGRAM DESIGN

Two-thousand forty-two (2,042) vehicles were tested under the program: 200 in Los Angeles, 542 in Houston and 325 in each of Denver, Phoenix, St. Louis and Washington, D.C.

Vehicles in the Los Angeles sample were from the 1978-1980 model years. These vehicles were tested to provide data on three-way catalyst technology, the technology with which each was equipped.

Vehicles in the Houston sample were from the 1975-1980 model years.

Vehicles in each of the Denver, Phoenix and St. Louis samples were from the 1975-1979 model years. Vehicles from these locations comprised the basic emission factors sample as did 325 of their counterparts in Houston from the same model years.

Vehicles completing the 542 Houston vehicle sample were selected and tested to satisfy a requirement for data on the 1980 model year and also to evaluate new car dealer as well as non-dealer parametric adjustment actions on vehicles which passed and which failed a short cycle emission test.

The 325 vehicles tested in Washington, D.C. were from the 1977-1980 model years: 275 from the 1977-1979 model years and 50 from the 1980 model year. The former were counterparts of the basic emission factor sample while the latter were tested to provide data for the 1980 model year.

Lists which prescribed the composition of each sample were provided by the EPA. Substitutions were allowed within certain limits. Procedures by which the test vehicles were obtained were in keeping with an EPA approved procurement strategy. Although some of the vehicles were from car lots and fleets, most were privately owned. Incentives were offered to promote owner participation.

All vehicles were subjected, in their as-received condition, to those parts of the 1975 Federal Test Procedure (FTP) which deal with cold and hot start exhaust emission tests. One-hundred vehicles in each of the Denver and St. Louis samples were additionally subjected to those parts of this procedure which deal with the evaporative emission test. These were vehicles from the 1978 and 1979 model years. All vehicles were subjected to the Highway Fuel Economy Test (HFET). Some vehicles which exceeded Federal Emission Standards applicable to their model year, were subjected to a restorative maintenance evaluation at all sites but the Houston site. The evaluation included up to three maintenance actions, each of which was followed by the 1975 FTP, the HFET and other tests specified for the particular site. Vehicles in the three-way catalyst equipped Los Angeles sample were subjected to a lengthier version of this evaluation with emphasis on the O₂ sensor.

Short cycle emission tests were performed in all but the Washington, D.C. site. The Federal Short Cycle, a mass emission test, was performed on all vehicles in the Los Angeles, Denver and St. Louis sites. All vehicles in Denver and St. Louis received the Federal Three Mode and Two Speed Idle Tests. All Los Angeles vehicles received the Loaded Two Mode, Federal Three Mode and Two Speed Idle Tests. Most Houston vehicles received the 50 Cruise, the Loaded Two Mode and Four Speed Idle Tests. Each 1979 model-year vehicle in the Denver and Phoenix samples received the New York City Cycle Test.

Most vehicles in the Phoenix, St. Louis and Washington, D.C. samples and some in

the Houston sample which were originally equipped with idle adjustment limiters but which had these limiters removed or disabled were used in an idle adjustment evaluation. Following as-received tests, these vehicles were sent to commercial repair facilities accompanied by a request for idle adjustments. Idle speed and mixture measurements were taken subsequent to the commercial repair facility's handling of the vehicle. Denver vehicles which met these same criteria were subjected to the same procedures except that laboratory personnel performed the adjustments.

Many vehicles in the Houston sample were concurrently used to satisfy requirements of the subject study as well as a requirement for inspection/maintenance (I/M) data which the EPA agreed to provide for the State of Texas and the City of Houston. Consequently, some data collected in Houston are common to the two studies. Information on the I/M portion of the combined efforts and pertinent data are contained in a separate report.

Other actions were taken in relation to each vehicle tested. These included: an emission control system maladjustment/disablement inspection, a tire inspection, a vehicle driveability evaluation and an interview of the vehicle owner to obtain historical information on the vehicle's maintenance and use.

Other study-related activities pertained to test equipment calibration and data review, reduction and reporting. Details concerning these and the activities described above are presented in the remainder of this section.

2.3 TEST VEHICLE PROCUREMENT

2.3.1 Sample Criteria

Criteria for the procurement and selection of test vehicles were provided by the EPA. Criteria for the basic emission factors sample were given on a list describing 325 vehicles from the 1975-1979 model years. Quantities required were designated in the descending order of model year, make, model size (subcompact, compact, intermediate, etc), engine size, carburetor type (fuel injected, 1 barrel, 2 barrel, etc.) and transmission

type (automatic, manual 3 speed, manual 4 speed, etc.). Quantities required by model year were weighted for the most part toward the later model years. Vehicles from the later model years are equipped with the latest in emission control technology and are also those on which the least amount of in-use data are available. Quantities required by make, model size, etc. were weighted in proportion to the rates at which these parameters appear in registration data for the U.S. as a whole. In situations where registration data were not available, as is normally the case for the most current model year, vehicle descriptions were based on sales projections provided by the manufacturers.

Substitution allowances were provided to take into account localized vehicle distributions not in conformance with the U.S. population as a whole as well as other factors which generally contribute to procurement difficulties. These allowances were reflected in the following minimum procurement requirements:

100% exact vehicle match to listed make and model year.

90% exact vehicle match to listed make, model year and engine size.

70% exact vehicle match to all listed parameters.

A relatively small number of vehicles tested under the FY 77 program were retested under the subject program. These vehicles were added to the test sample in a position which provided the closest possible match to the FY 79 program list. Vehicles tested under both programs were regarded as exact matches.

Other criteria for the emission factors sample consisted of limitations on procurement sources. The use of fleet and rental vehicles was limited to no more than ten percent for each model year. The use of vehicles from civic, fraternal and other organizations was limited to no more than fifty percent at each site. The use of vehicle groups from organizations with an automotive orientation such as sports car clubs, however, was prohibited.

Procurement criteria for the 1980 model-year samples tested in Houston and Washington, D.C. were essentially the same as those prescribed for the emission factors

sample. Compositions of these samples were also defined by the EPA. The only criteria applied to the Los Angeles sample were that each vehicle be equipped with a three-way catalyst and also that a reasonably good mixture of model years and makes were obtained, reasonably good in relation to a number of practical constraints which existed at the time.

Vehicles used for the new car dealer/non-dealer, short test pass/fail evaluation in Houston complied with requirements of the emission factors list. These vehicles were tested independent of any other program activity as a result of the priority placed on this evaluation by the EPA.

2.3.2 Procurement Plan

The plan for procuring test vehicles primarily consisted of the use of vehicle registration lists and direct mail solicitations.

Several postal zip-code areas were selected in each metropolitan area on the basis of their proximity to the laboratory. Vehicle owners residing within these areas were selected from commercially available computerized vehicle registration files by the random process of nth name selection whereby each 1, 2, 3, 4 or nth name appearing in the file is selected. The value of n is determined by the total number of vehicles in the file in relation to the number of vehicles needed. Selected vehicle owners were mailed a letter and a post-paid information reply card. The letter explained the program's purpose and nature and invited participation. The reply card was provided to enable the owner to supply vehicle information not otherwise available.

Experience provides the basis for determining the number of mailings required. Affirmative responses vary on a site-by-site basis although they are generally between five and ten percent of the total number mailed. Approximately thirty mailings were sent for each vehicle required.

Mail solicitations produced approximately ninety percent of the vehicles tested. The remainder were obtained as a result of appeals directed through the news media and from car lots, rental car agencies and referrals from other participants.

2.3.3 Incentives

An incentive package prescribed by the EPA was offered and provided for each vehicle tested. The package consisted of:

- A \$50 U. S. Savings Bond

- A late-model loan vehicle to serve as a substitute for the test vehicle

- Fuel for the loan vehicle

- A full tank of fuel for the test vehicle upon return to its owner

2.3.4 Test Vehicle General Handling

Vehicle owners were contacted from telephone numbers given on the reply cards. Vehicle information was confirmed and any missing information was obtained during this contact. Test schedules were also established at this time. Privately owned vehicles were delivered to the laboratory. Laboratory personnel picked up and returned vehicles which were procured from rental car agencies and car lots.

The prospective test vehicle was examined upon arrival at the laboratory to confirm compliance with the sample specification and to assure suitability for testing. A relative few were rejected by reason of incorrect owner supplied engine, carburetor and/or other equipment identifying information. Relatively few other vehicles were rejected at this or some subsequent point due to exhaust system leakage, transmission problems, brake problems or related factors. Acceptance activities included an incoming vehicle status inspection which was used to limit laboratory liability. Test and loan vehicle exchange agreements were completed upon acceptance of the test vehicle and an EPA-furnished questionnaire was administered to the owner. The questionnaire is designed to gain usage, maintenance and other information concerning the vehicle. The vehicle was subsequently moved to a staging area where remaining pre-test operations were completed.

The vehicle was returned to the staging area for depreparation procedures and refueling after testing was completed. It was then moved to a parking area where it remained until picked up by the owner.

2.4 FACILITIES AND EQUIPMENT

2.4.1 Test Locations and Facilities

Two permanent and four temporary laboratory facilities were used in the study.

Their locations and elevations above sea level were as follows:

Denver	19900 East Colfax Avenue Aurora, Colorado 5,480 ft
St. Louis	10862 Metro Court Maryland Heights, Missouri 520 ft
Los Angeles	1780 S. Oak, Suite C Torrance, California 100 ft
Phoenix	1638 W. 12th Place Tempe, Arizona 85281 1,100 ft
Houston	8564 Katy Freeway, Suite 132 Houston, Texas 77024 60 ft
Washington, D.C.	3832 S. Four Mile Run Drive Arlington, Virginia 22206 275 ft

The laboratory in Denver is a permanent facility containing about 20,000 square feet of office and laboratory area. The facility is situated east of Denver, two miles (3.2 km) from the city limits. Testing under the contract was performed in an area containing about 7,000 square feet. Ambient air temperature was maintained through the use of gas operated heaters and evaporative coolers. The St. Louis laboratory, a permanent facility which ATL operated at the time but since closed down, had about 12,000 square feet of office and laboratory area. The building was located nine miles (14.5 km) south of St. Louis. The ambient air temperatures in the soak and test areas were controlled by overhead heaters and by three ten-ton air refrigeration units.

The other laboratories were established and maintained as temporary facilities. The Los Angeles laboratory was situated approximately ten miles (16 km) south of the Los

Angeles city limit and encompassed 9,000 square feet of office and laboratory space. Vehicle soak and testing area ambient air temperatures were controlled by heaters provided with the building and by four 3 1/2 ton portable air refrigeration units. The Phoenix facility contained 8,000 square feet of office and laboratory area, and was located one mile (1.6 km) east of the Phoenix city limit. Heat generated by vehicle operation on the dynamometer was generally effective in maintaining the necessary ambient level. A gas unit heater provided the balance of heat. Permanently installed evaporative type air coolers were used when needed. The Houston facility, located within the Houston city limits, contained 7,200 square feet of laboratory and office space. Cooling for the facility was furnished by two permanently installed twelve and one-half ton air refrigeration units which were supplemented by one 3 1/2 ton portable air refrigeration unit. The laboratory in Washington, D.C. encompassed 9,000 square feet of office and laboratory area and was located one mile (1.6 km) southwest of the Washington, D.C. boundary. Cooling was provided by four portable air refrigeration units.

2.4.2 Chassis Dynamometers

Chassis dynamometers used in the study were Clayton Models ECE-50. The ECE-50 has two continuous rolls, 78 inches in length and 8 5/8 inches in diameter. Axial spacing of the rolls is 17 1/4 inches. The tach-generator was installed on the rear roll. A counter which measured distance traveled by the test vehicle was also installed on the rear roll. Distance measurements were taken but these measurements were not used in calculating test results. Accuracy of the counter was such that it recorded distance traveled in increments under 0.01 of a mile.

Each dynamometer was equipped with digital speed meters which are linear with speed and accurate to within ± 2.0 km/hr (± 1.2 mph) over the 0 to 95 km/hr (0-59 mph) range. They were also equipped with digital power meters which are accurate to ± 0.25 hp (± 0.187 kw).

The dynamometers were also equipped with direct drive inertia assemblies which provide 250 pound inertia increments from 1750 to 5500 pounds. Some dynamometers have 125 pound incremental capabilities but only the 250 pound increments were used.

The dynamometers were lubricated and maintained in accordance with Clayton's requirements.

2.4.3 Constant Volume Sampler

Each constant volume sampler (CVS) used was the AESI Model 1000. The Model 1000 is a positive displacement pump (PDP) type equipped with a gas to water heat exchanger and six sample bags. All plumbing in the sampling and calibration systems was of stainless steel or teflon construction. Leak tight convoluted stainless steel tubing was used to connect the CVS and the vehicle tailpipe. Several lengths were provided to keep the exhaust run as short as practical. Accuflex brand silicone rubber adapters were used to connect the tubing to the tailpipe.

Samplers were modified from the conventional design to facilitate automated sampling system evacuation/leak check.

2.4.4 Analytical Instruments

Listed below are instrument models, and ranges, which were part of the analytical system used in Los Angeles, Phoenix, Houston and Washington, D.C. for FTP, HFET and other diluted sample analyses:

- 2 each Beckman Model 400 FID's providing full scale C ranges of:
0-50 ppm, 0-100 ppm, 0-300 ppm, 0-1,000 ppm and 0-3,000 ppm
- 1 each TECO Model 10 CL NO_x analyzer with full scale ranges of:
0-100 ppm, 0-250 ppm, 0-1,000 ppm and 0-2,500 ppm
- 1 each Bendix Model 8501 NDIR CO analyzer providing full scale ranges of:
0-100 ppm, 0-500 ppm, 0-.3%, 0-3% and 0-5%
- 1 each Beckman Model 315B NDIR CO₂ analyzer with full scale ranges of:
0-2.5%, 0-4% and 0-8%

The analytical system used in Denver contained the instruments and ranges given above except that two Horiba Model OPE-115 NDIR CO analyzers were used in place of the

Bendix models and one Beckman Model 865 NDIR CO_2 analyzer was used in place of the 315B. Models given above were also used in St. Louis except a Beckman Model 865 NDIR CO_2 analyzer was also used in place of the 315B.

Undiluted emission analysis (New York City Cycle, Two Speed Idle, Federal Three Mode and the other direct tailpipe tests) was performed using the following analyzers and ranges:

Chrysler Model III C NDIR CO analyzer with full scale ranges of:
0-300 ppm C_6 and 0-2,000 ppm C_6
0-0.5% CO and 0-10% CO

TECO Model 10 CL NO_x analyzer with full scale ranges of:
0-100 ppm, 0-250 ppm, 0-1,000 ppm, 0-2,500 ppm and 0-10,000 ppm

The diluted and undiluted exhaust analyzers and the evaporative emission analyzers were respectively situated within rack-type console cabinets. Sampling, analytical and calibration system plumbing was of stainless steel or teflon construction.

2.4.5 Data Acquisition

The following equipment was used for the acquisition of test data:

Wet and dry bulb temperatures of air supplied to the vehicle under test and temperature of the CVS exhaust gas/dilution air mixing point were recorded on a Soltec Model DB, three channel, ink stylus, strip chart recorder, with a chart width of approximately eleven inches.

Barometric pressure was recorded on a Taylor Model 6450 recording barometer.

Soak area temperature was recorded on a Rustrak Model 2133, single channel, pressure stylus, strip chart recorder, with a chart width of approximately two inches and a range from 10°C to 37.5°C (50°F to 100°F).

The driver's aid was an Esterline Angus two channel, off-set heat stylus, strip chart recorder, with a chart width of approximately eleven inches. The leading pen records the dynamometer speed command signal; the lagging pen records the feedback signal.

Exhaust emission analyzers were connected to Texas Instruments (TI) Model Servo-riter II, two channel, ink stylus, strip chart recorders, with a chart width of approximately eleven inches and 100 division full scale chart paper. Diluted CO and CO_2 were connected to one of these recorders. Diluted HC and NO_x were connected to a second. Undiluted CO, HC and NO_x were connected to a three channel version of the TI Servo-riter II.

CVS pump revolutions were displayed on an electronic digital meter.

A Data General Model Nova II computer was used to generate driving schedule traces and as a cross-check to ensure accuracy of the analyzer ranges. The computer also provides print-outs of distance traveled by the test vehicle and integrates analyzer and test cell temperature traces.

2.4.6 Sealed Housing for Evaporative Determination

The evaporative emission tests conducted in Denver and St. Louis were performed using the Sealed Housing for Evaporative Determination (SHED) technique. The SHED is primarily of aluminum construction. Five expansion panels or windows, each of two feet by three feet dimensions, are situated in the back and in one of the side walls of the enclosure. The door of the enclosure is also designed to act as an expansion panel. The panels are of Tedlar construction. Nominal dimensions of the SHED used in St. Louis were twenty-one feet deep by twelve feet wide by ten feet high. The Denver SHED has nominal dimensions of twenty-four feet deep by twelve feet wide by ten feet high.

Two air-to-water heat exchangers regulated the ambient air temperature inside the enclosure between 20°C and 30°C (68°F and 86°F) during testing. Each of the heaters was equipped with a radiator and a propeller-type fan. The radiator and fan were contained by a small aluminum enclosure with the fan located behind the radiator. In this configuration each unit supplied about 450 cubic feet of air per minute. The units were located in opposite corners of the SHED with the air flow directed along the enclosure's side. SHED radiator pairs were cooled with a closed system water supply. The temperature of the water was maintained at $21.1^{\circ}\text{C} \pm 1.1^{\circ}\text{C}$ ($70^{\circ} \pm 2^{\circ}\text{F}$).

Two type J (iron-constantan) thermocouples were installed on opposite walls of the SHED to measure enclosure temperature. Each was located along the front-to-rear midline of the wall, three feet from the floor. The thermocouples were electrically joined to average temperatures of the enclosure at the two points.

A two kw (maximum) heating blanket was used to heat vehicle tank fuel during the diurnal (or heat build) segment of the test. A manually adjustable rheostat controlled

power to the blanket which, in turn, controlled the heat-build rate of the fuel. To monitor the heat-build rate, a type J thermocouple was used. The thermocouple joint was soldered to a cleaned area of the vehicle tank at the approximate mid-point between tank bottom and the forty percent fuel fill line.

A Beckman Model 400 FID HC analyzer monitored hydrocarbon concentrations within the enclosure during the test. Operational ranges of this analyzer were 0-50 ppm, 0-100 ppm and 0-300 ppm C.

2.4.7 Laboratory Standard Calibration Gases

A set of secondary calibration gas standards was used at each site to calibrate the analytical instruments. One complete set was used for Denver, another was used for St. Louis and a third was used for the four temporary sites. All secondary calibration standards were identified from a set of primary standards which, in turn, were identified by the EPA's laboratory in Ann Arbor.

Primary and secondary calibration gases were bi-blends (CO, CO₂ and NO_x plus zero-grade N₂ as the diluent, HC as propane plus zero-grade air as the diluent).

FID fuel gases were a mixture of 40% H₂ and 60% N₂. Fuel for the SHED FID was a mixture of 40% H₂ and 60% He. Zero gas impurities were maintained below 1 ppm C, 1 ppm CO, 400 ppm CO₂ and 0.1 ppm NO. NO_x calibration gases contained less than 2% NO₂.

2.4.8 Miscellaneous Equipment

As-received vehicle tank fuel was analyzed for lead content. The analysis was performed using a Science Essentials fuel lead test kit (Mobil Method 1125-74).

A Hartzell Model N24DW propeller-type fan, nominally air flow rated at 5300 cubic feet per minute, was used in connection with dynamometer testing to supply vehicle frontal and underhood cooling air.

Wheel chocks and a ratcheting-type winch were used to secure vehicles on the dynamometer and prevent them from rocking on the rolls. A rubber belt dressing was

applied to drive tires immediately before cold start testing began to reduce slippage between the drive tires and dynamometer rolls; however, belt dressing was not applied to the tires of vehicles subject to the SHED procedure.

The usual complement of ignition scopes, timing lights, tachometers, hand tools and other engine diagnostic and tune-up equipment was used to perform the emission-related inspections, adjustments and repairs. Special diagnostic and repair equipment was provided and used as needed.

2.5 EQUIPMENT CALIBRATION AND VERIFICATION

Program test equipment calibration and verification requirements were met through application of the following procedures.

2.5.1 Chassis Dynamometer

Dynamometer calibration was performed initially and confirmed each two weeks thereafter.

Initial calibration included setting the speed meter to true zero with the dynamometer at rest followed by establishment of the upscale span point (46.3 mph). A fixed rate strobe-light was used to establish the upscale span point. The power meter was zeroed with no weight applied to the torque area. A known weight was subsequently applied and the power meter was adjusted accordingly. Dead weight calibration was followed by dynamic calibration using the coast down technique to establish the relationship between indicated and actual horsepower.

Bi-weekly calibration confirmations included the speed point checks and the coast-downs. Coastdown calibrations were maintained within ± 0.746 kw (± 1 hp) for any and all inertia weights.

Calibration of the driver's aid was checked in relation to the speed meter indication before and after each test. Pre-test driver's aid speed checks were maintained within ± 1 mph of the indication on the dynamometer speed meter.

2.5.2 Constant Volume Sampler

The constant volume sampler was subjected to an initial checkout and flow calibration at each site. A Meriam Model 50-MC2-6F laminar flow element (LFE), which has an air flow rating of 1,000 cfm, was used as the flow standard. LFE calibration is traceable to the National Bureau of Standards. A minimum of ten points, five on each side of the normal set point, were measured on the CVS pump's single range. Auxiliary devices employed for the calibration included: a mercury barometer for measuring absolute ambient pressure, a close tolerance mercury thermometer for measuring blower inlet temperature, a U-tube water manometer for measuring pressure drop across the blower and blower inlet pressure and a close tolerance inclined water manometer for measuring pressure drop across the LFE. Calibration was such that no data point deviated more than 0.5% from the least squares best-fit line through the points measured and that no data point deviated more than 0.25% from the least squares best-fit line through all points.

CVS calibration was confirmed daily thereafter by propane injection and recovery. The injected amount was such as to have produced a concentration falling in the upper one-third of the 0-300 ppm FID range. Recovery within $\pm 2\%$ of the injected amount was acceptable. A recovery outside the acceptable range required corrective action and two successive recoveries within range before testing was resumed.

2.5.3 Analytical Instruments

Emission analyzers were set-up in accordance with procedures specified by the manufacturers and subjected to initial calibration. FID and NO_x analyzers were calibrated at three points spread somewhat evenly across each range. CO and CO_2 analyzers were calibrated at seven points spread somewhat evenly across each range. Initial calibration curves were maintained such that the actual calibration point was within $\pm 5\%$ of the curve value and the difference between the actual point and the curve was within $\pm 1\%$ of the full scale value.

Calibration curves for the analyzers were subjected to a complete check on a weekly basis. Each curve point was maintained within ± 1 division (100 divisions, full scale) of the point established in the original calibration.

Analyzers were zeroed with zero gas and spanned on the range in-use at 80 percent to 100 percent of full scale.

Efficiency of the NO_x analyzer converter was checked daily and maintained between ninety percent and 100 percent.

CVS sample bags were purged with nitrogen, evacuated and leak-checked prior to each test. Other procedural precautions included zero and span point sets immediately before exhaust sample analysis and zero and span point verification immediately following sample analysis. Verified zero and span points were maintained within ± 1 division of the set points. Noise levels of recorded analyzer outputs were maintained within ± 0.5 divisions.

Analyzers used for tailpipe emission measurements were zeroed with zero gas and spanned with known span gases immediately before each test. These analyzers were otherwise operated in accordance with the manufacturer's specifications.

2.5.4 Sealed Housing for Evaporative Determination

SHED calibrations were performed initially and each thirty days thereafter.

After purging with fresh air the enclosure was sealed, a background hydrocarbon reading was obtained and approximately four grams of instrument-grade propane were injected into the enclosure. Heat exchanger fans were in operation during the injection and subsequent period. After five minutes of mixing, the enclosure's hydrocarbon level was measured and the amount of propane recovered was calculated. Recovery within ± 2 percent of the injected amount indicated an acceptable calibration.

A retention test was performed following each calibration. The enclosure remained sealed over an additional period of four hours with the heat exchanger fans in

continuous operation. The amount of hydrocarbon remaining in the enclosure at the end of this period was again measured and converted to propane by calculation. A four hour retention within ± 4 percent of original recovery indicated the retention quality of the SHED to be acceptable.

Each SHED was initially checked for hydrocarbon background emission. After purging with fresh air the enclosure was sealed, an initial hydrocarbon measurement was taken and a final hydrocarbon measurement was taken four hours later. A four hour increase of 0.4 grams of hydrocarbon or less indicated the enclosure's emission characteristic to be acceptable.

2.6 TEST PROCEDURES

Tests were performed in the following sequence:

Diurnal segment of the SHED tests (only in Denver and St. Louis, if applicable)

Federal Test Procedure (all vehicles)

Hot loss segment of the SHED test (only in Denver and St. Louis, if applicable)

50 Cruise test (most vehicles in Houston)

Highway Fuel Economy Test (all vehicles)

New York City Cycle (1979 model-year vehicles in Denver and Phoenix)

Federal Short Cycle test (all vehicles in Los Angeles, Denver and Phoenix)

Two Speed Idle Test (all vehicles in Los Angeles, Denver and St. Louis)

Four Speed Idle Test (most vehicles in Houston)

Federal Three Mode Test (all vehicles in Los Angeles, Denver and St. Louis)

Two Mode Loaded Test (all Los Angeles and most Houston vehicles)

2.6.1 Vehicle Preparation

Subsequent to acceptance the vehicles were drained of as-received fuel and refilled to forty percent of tank capacity. A sample of fuel drained from each vehicle was retained for lead analysis. Those vehicles requiring unleaded fuel were supplied with

Indolene Clear. All others were supplied with Indolene 30.

Subsequent to draining but prior to refueling, those Denver and St. Louis vehicles which were scheduled to receive SHED tests were subjected to a pressure check. The fuel system was first sealed and a stabilized pressure of fourteen inches H_2O was applied to the system. Fuel system pressure was observed and recorded five minutes after stabilization was achieved. No additional pressure was added in the interim. The thermocouple used in the heat build segment of the test was attached to the tank following the pressure check.

All vehicles were operated for a period of ten minutes on a predetermined public road route subsequent to refueling. The purposes of such operation were threefold: to purge non-test fuel from the fuel system, to bring the vehicle to normal operating temperature and to assess vehicle operating characteristics. Moderate to severe operating difficulties, in particular, were noted for later reference in the cold start tests.

After test preparation procedures were completed, the vehicle was driven to an indoor, temperature controlled area and shut down to begin the temperature stabilization (soak) period prescribed by the Federal Test Procedure.

2.6.2 Equipment Preparation

Each facility operated for the most part at the rate of three shifts per day. Approximately twenty-one hours of the operating day were devoted to testing. The remaining three hours were used for calibrations and daily equipment checks. Each facility for the most part also operated at the rate of six days per week. The seventh day was also used for calibrations and for scheduled and unscheduled maintenance of the laboratory and its equipment; consequently, equipment was rarely in a shut-down mode. When it had been shut down for an extended period of time, however, certain reactivation procedures were followed.

Equipment which had been idle or in a stand-by condition was fully activated to begin warm-up. Such equipment included the water heater and mass pump of the CVS

and each of the analytical instruments. If not subjected to extended operation in the two hour period preceding a test the dynamometer was also warmed-up by means of fifteen minutes of vehicle operation on the dynamometer at thirty mph.

With all equipment at normal operating temperature, sensitivity of the constant volume sampler's automatic leak detection system was checked and adjusted as necessary. A leak-check of the undiluted tailpipe analytical system was also performed. Efficiency of the NO_x analyzer thermal converter was checked, strip-chart recorders and other elements of the data acquisition system were aligned with analyzer outputs and the propane recovery test was performed. Calibration of the dynamometer speed meter and driver's aid recorder was also checked for accuracy and adjusted as needed.

Other minor laboratory maintenance and pre-test requirements were attended to during the daily three hour non-test period as needed.

2.6.3 Federal Exhaust Emission Test Procedure

The Federal Exhaust Emission Test was performed in accordance with those parts of 40 Federal Register 126 which deal with cold and hot start tests.

This test, commonly referred to as the Federal Test Procedure (FTP) is a test which utilizes a constant volume sampler (CVS) and which produces mass emission test results. It was preceded by a minimum vehicle soak period of twelve hours during which the vehicle remained unstarted and with all accessories off in ambient temperatures between 20° C and 30° C (68° F and 86° F). Maximum soak time for this program was limited to twenty-four hours.

At the end of the soak period the vehicle was placed on the dynamometer in preparation for the cold start portion of the test. A cooling fan which directs air to the vehicle only during exhaust sampling periods was situated with its center at the middle of the vehicle grille and twelve inches away. The engine compartment was fully opened and a collector tube which directs all exhaust to the CVS was attached to the vehicle tailpipe.

The FTP consists of three sampled portions. Background air and CVS diluted exhaust samples are collected for each portion. The cold transient portion is nominally 505 seconds long and covers a distance of 5.78 km (3.59 miles) at an average speed of 41.19 km/hr (25.6 mph). The cold stabilized portion is nominally 869 seconds in duration covering 6.21 km (3.86 miles) at an average speed of 25.74 km/hr (16.0 mph). The hot transient portion is a hot start repetition of the cold transient portion.

Cold transient CVS sampling commenced with engagement of the engine starter. The cold transient portion of the FTP driving schedule commenced with the starting of the engine. The time between starter engagement and the point at which the engine begins to run of its own accord added to the sampling interval. Also, any stall encountered during this or the two subsequent FTP portions added to the sampling interval of the portion in which it occurs. The driving schedule was stopped in place when a stall occurred and was restarted from that same place after the engine was restarted. Cold transient sampling terminated at the 505 second point of the driving schedule.

Cold stabilized sampling commenced at the 505 second point of the driving schedule and terminated when the engine stopped running after the ignition was turned off at the 1372 second point, the end of the driving schedule. Any after-run of the engine added to the sampling period of this test portion.

A soak period of ten minutes followed the end of the cold stabilized portion. During this period the engine and cooling fan were off, the engine compartment was closed and the CVS exhaust collection tube was disconnected from the tailpipe. At 10 ± 1 minutes into the soak period, the engine compartment was re-opened, the collector tube was reconnected and the engine starter was engaged once more to begin the hot transient portion. The fan was turned on upon engagement of the starter and sampling also commenced. Hot transient sampling continued to the 505 second point of the schedule at which time the test was concluded.

2.6.4 Evaporative Emission Test Procedure

Evaporative emission tests were performed in accordance with those parts of 41 Federal Register 164 which deal with evaporative emission testing, the SHED test.

The SHED test consists of two segments: the diurnal (or heat build) segment and the hot loss segment.

The diurnal segment was preceded by a soak period of eleven to twenty-three hours (in this case) in duration. At the end of this period, test fuel (which was put in the vehicle prior to the 10 minute preconditioning drive) was drained and chilled fuel, at a temperature between 10°C and 13.2°C (50°F and 55°F) in this case, was added to forty percent of the tank's capacity. The vehicle was subsequently placed in the SHED with the fuel filler cap off, the luggage compartment and all windows open and with the SHED ventilation system in operation. The vehicle tank heater (blanket) was attached to the tank and the tank thermocouple was connected to a recorder. Power was applied to the heater and the rising temperature of tank fuel was observed. When tank temperature reached the 15.6°C (60°F) point, the vehicle tank cap was installed, SHED ventilation systems were turned off, the enclosure was sealed and the hydrocarbon background measurement was taken. Tank fuel was heated in the subsequent period such that its temperature rose linearly within $\pm 1.1^{\circ}\text{C}$ ($\pm 2^{\circ}\text{F}$) from 15.6°C to 29.1°C (60°F to 84°F) within one hour (SHED interior hydrocarbon measurements were taken each fifteen minutes). At the end of the one hour period a final hydrocarbon reading was taken. The enclosure was opened and purged, the heater was disconnected and the thermocouple connection was parted. The vehicle was subsequently moved to the dynamometer for the FTP. Maximum permissible time lapse between the end of the diurnal test and the start of the FTP is one hour.

All external connections to the vehicle were parted upon conclusion of the FTP and the vehicle was driven or otherwise moved into the enclosure for the SHED test's hot loss segment. Just before entering the enclosure, if driven, the engine was shut-down. SHED

ventilation systems were in operation during the period immediately preceding vehicle entry. The vehicle was brought to rest within the enclosure, windows and luggage compartments were opened, SHED ventilation systems were turned off, the enclosure was sealed and the hot loss hydrocarbon background reading was obtained. The vehicle remained in the SHED for the subsequent one-hour period. (Hydrocarbon measurements were taken each fifteen minutes). At the end of this period the final hydrocarbon reading was taken, the enclosure was opened and ventilated and the vehicle was removed.

Air temperatures were monitored continuously during each of the diurnal and hot loss segments of the test. Temperatures indicated by two electrically connected thermocouples, one of which was placed on one front to rear centerline of the two enclosure sidewalls and the other of which was placed on the other centerline, were maintained between 20°C and 30°C (68°F and 86°F) during both segments of the test.

2.6.5 50 (mph) Cruise Test Procedure

In this case the 50 Cruise Test was conducted during the three minute period of fifty mph preconditioning which preceded the Highway Fuel Economy Test.

Undiluted HC, CO and NO_x emission measurements were taken in connection with this test. Equilibrium of vehicle speed, engine speed and analyzer traces were obtained before the reported test readings were bracketed and integrated.

The 50 Cruise Test was inherently preceded by a sustained period of vehicle operation (eg, the 1,372 second FTP driving schedule) by reason of its connection with preconditioning for the Highway Fuel Economy Test.

2.6.6 Highway Fuel Economy Test Procedure

The Highway Fuel Economy Test (HFET) was started within the fifteen minute period following conclusion of the FTP. Unsampled vehicle operation over the 1,372 second FTP driving schedule preceded this test whenever SHED tests were involved.

The test was immediately preceded by a three minute period of operation at 80.5 km/hr (50 mph). Within one minute following the end of this period the vehicle was

brought to idle and the HFET driving schedule was begun. CVS sampling commenced upon commencement of the schedule and continued to the end of the 765 second, 16.4 km (10.2 miles) HFET driving schedule. Fuel economy was calculated from emission results by means of the Federal Register-contained carbon balance equation. Power settings, inertia weights, emission sampling procedures, cooling air temperatures and cooling fan placement and operation were identical to those of the Federal Test Procedure.

2.6.7 New York City Cycle Test Procedure

The New York City Cycle is a mass emission test employing CVS sampling procedures. The driving schedule consists of a non-repetitive sequence of idle, acceleration, cruise and deceleration modes which cover a distance of 1.907 km (1.185 miles). The test is 599 seconds in duration. It was preceded by a 6 ± 1 minute period during which the engine was idling with the underhood cooling fan on and the engine compartment open. Dynamometer loads, inertia weights, transmission operation and other test parameters were identical to those of the Federal Test Procedure.

2.6.8 Federal Short Cycle Test Procedure

The Federal Short Cycle is also a mass emission test which employs CVS sampling procedures. It contains nine vehicle operating modes and is 125 seconds in duration. It was preceded by a 6 ± 1 minute period during which the engine was idling with the underhood cooling fan on and the engine compartment open. Dynamometer loads, inertia weights, transmission operation and other parameters of this test also were identical to those of the Federal Test Procedure.

2.6.9 Two Speed Idle Test Procedure

The Two Speed Idle is a test consisting of volumetric sampling of undiluted exhaust emissions during two steady state engine operating conditions. The first operating mode is 2,500 engine rpm with the transmission in neutral. The second is normal idle, also with the transmission in neutral.

This test was preceded by a 6 ± 1 minute preconditioning period during which the engine idled with the underhood cooling fan on and the engine compartment open. At the end of this period the engine was operated at 2,500 rpm for a maximum of three minutes and then at idle for the same maximum period. Equilibrium of engine speed and undiluted HC, CO and NO_x readings was attained before the reported readings were bracketed and integrated.

2.6.10 Federal Three Mode Test Procedure

The Federal Three Mode Test is also a test employing volumetric sampling of undiluted exhaust emissions. It consists of three vehicle operating modes: high cruise, low cruise and idle. Dynamometer horsepower loading for the high and low cruise modes which are 83.7 km/hr (52 mph) and 40.2 km/hr (25 mph), respectively, simulate average power occurring at these same speeds during the FTP driving schedule.

A 6 ± 1 minute period during which the engine was idling, the underhood cooling fan was on and the engine compartment was open served as preconditioning. At the end of this period the vehicle was operated for a maximum of three minutes at each, and in the order, of high cruise, low cruise and idle. Equilibrium of vehicle speed and undiluted HC, CO and NO_x was maintained for thirty seconds before the reported readings were bracketed and integrated. The inertia weight setting for this test was either zero or the lowest setting possible for the dynamometer.

2.6.11 Loaded Two Mode Test

The Loaded Two Mode Test employs volumetric exhaust emission sampling at one mode with the vehicle operating at 48.3 km/hr (30 mph) and 6.714 kw (9 hp) and at one with the engine idling with the transmission in neutral. Maximum duration of each mode is three minutes. Speed and HC, CO and NO_x equilibrium is maintained for 30 seconds before the reported readings are bracketed and integrated.

This test was also preceded by the 6 ± 1 minute idle period with the underhood cooling fan on and the engine compartment open. At the end of this period the vehicle was

operated, and emission readings were taken, at the cruise mode, then at the idle mode. Dynamometer inertia setting for the cruise mode was either zero or the lowest setting possible.

2.6.12 Four Speed Idle Test

Also employing volumetric sampling, the Four Speed Idle is a test having four modes when automatic transmissions are involved and three when they are not. It was preceded by the 6 ± 1 minute idle period with the cooling fan on and the engine compartment open. Subsequent to this period the vehicle was operated in the order of: idle in neutral, idle at 2,500 engine rpm, idle in neutral and in the case of an automatic transmission-equipped vehicle, idle in drive with the brakes applied. The maximum period for each mode was three minutes. Speed and HC, CO and NO_x equilibrium was maintained for thirty seconds before the reported readings were bracketed and integrated.

2.6.13 Vehicle Inspection Procedure

The procedure used to determine incoming condition of the test vehicles consisted of the measurement of basic engine parameters and visual and functional inspections of emission control systems, subsystems and parts. Parameters measured included those of idle speed, ignition timing and dwell and idle HC and CO emissions. Whether the idle mixture was rich or lean for the given vehicle was also determined by enriching the mixture with propane. Visual inspections were performed to determine: the presence or absence of the air pump, catalytic converter, idle adjustment limiters, modulators, delay valves and the like; the routing of wires, vacuum lines and the like; and any modifications which would affect emission control system operation including those to the fuel filler neck which enable the use of leaded fuel. Functional checks were performed to determine operational status of: the ignition, distributor and its advance-retard mechanisms; the carburetor and its vacuum and electrical control devices; the induction system and its sensors, switches, modulators, etc; the exhaust gas recirculation (EGR) system and associated vacuum and pressure devices, temperature sensing devices

and so on. Visual and functional inspections of Los Angeles test vehicles included those of the three-way catalyst system and sub-systems.

2.6.14 Restorative Maintenance Evaluation

The first fifty vehicles in each of Denver, Phoenix, St. Louis and Washington, D.C. found to have exceeded one or more of the Federal HC, CO and NO_x exhaust standards by ten or more percent, the restorative maintenance (RM) emission standards, were subjected to one classification of RM, the four-step class. All vehicles in the three-way catalyst-equipped Los Angeles sample were subjected to another, the five-step class. Houston vehicles were subjected to a third classification. By reason of their peculiarity with respect to inspection/maintenance objectives, the Houston RM evaluation procedures and results are presented in a separate report. Block diagrams for the four site and Los Angeles RM evaluation sequences are respectively contained in Figures 1 and 2.

Vehicles qualifying for the four site RM evaluation were subjected to the Maladjustment/Disablement Inspection. This inspection was an integral part of the vehicle inspection procedure described above. Only emission control maladjustments and disablements which were found in the course of this inspection and which came under the definition of such were corrected. Vehicles on which this action was taken were subjected to Test Repetition #1. This and Test Repetitions #2 and #3 are repetitions of the vehicle's as-received tests. Those vehicles which failed RM emission standards on the basis of Test Repetition #1, along with those qualified RM evaluation vehicles which neither required nor received any maladjustment/disablement corrective action, were subjected to the Idle Speed/Mixture Inspection. Those which passed Test Repetition #1 were returned to their owners.

Vehicles which failed the Idle Speed/Mixture Inspection were adjusted accordingly and subjected to Test Repetition #2. A vehicle whose idle speed and mixture could not be brought into specifications through adjustment preceded into the Emission Component

Figure 1, Restorative Maintenance Evaluation for Denver, Phoenix, St. Louis and Washington, D.C.

Repair and Tune-up Procedure. A vehicle which passed Test Repetition #2 was returned to its owner.

The Emission Component Repair and Tune-up Procedure involved the replacement or repair of malfunctioning emission control devices and a major tune-up. Test Repetition #3 followed these repair actions. The vehicle was returned to its owner subsequent to this test regardless of its status with respect to emission levels.

Following as-received tests on the three-way catalyst-equipped Los Angeles sample, each vehicle was subjected to the Maladjustment/Disablement Inspection, an integral part of the all-vehicle inspection procedure in this case, also. Given that 100 allotted RM test repetitions had not been exhausted, vehicles which failed RM standards on the basis of as-received tests entered the evaluation. RM standards for vehicles in the Los Angeles sample were the California Exhaust Emission Standards for the vehicle model year. Vehicles which passed these standards in their as-received condition went back to their owners.

Upon entering the evaluation, the vehicle followed one of two initial paths. New O_2 sensors were installed in those vehicles which were otherwise seemingly intact (i.e., no obvious maladjustment/disablement and idle speed and mixture within specifications) in the one path. No other work was done on these vehicles. Vehicles which followed the second path were those having obvious maladjustment/disablement and/or idle speed/mixture out of specification. These items were corrected, a new O_2 sensor may or may not have been installed depending on diagnostic indications, and Test Repetition #1 was conducted. Vehicles following the second path and passing RM standards at the Test Repetition #1 point were returned to their owners. Vehicles following the second path, also, but failing RM standards at this same test point subsequently followed one of two more paths, one leading through the installation of a new O_2 sensor, if the original one was still in place, and the other calling for reinstallation of the original sensor, if a new one had already taken its place. Vehicles following the former of the two paths joined

Figure 2, Restorative Maintenance Evaluation for Los Angeles

those whose as-received O₂ sensors were initially replaced but whose emission systems were otherwise seemingly intact. Test Repetition #2 was conducted on these vehicles. Vehicles which failed RM standards at the Test Repetition #2 point either joined or rejoined for original O₂ sensor reinstallation vehicles which followed the latter of the above two paths. The evaluation was concluded on those vehicles which passed RM standards at the Test Repetition #2 point.

All vehicles remaining in the evaluation after Test Repetition #2 had their O₂ sensors removed at some previous point and reinstalled at the action point following Test Repetition #2. Less obvious forms of maladjustment/disablement were then corrected and Test Repetition #3 was performed. Vehicles which passed RM standards on the basis of Test Repetition #3 were returned to their owners. Vehicles which failed subsequently had any malfunctioning emission control devices replaced or repaired and a major tune-up. This action was followed by Test Repetition #4 at which point the evaluation was concluded.

2.6.15 Idle Adjustment at Commercial Repair Facilities Evaluation Procedure

This procedure involved the use of qualified test vehicles at each of the Denver, Phoenix, St. Louis and Washington, D.C. sites. To qualify, a vehicle which had originally been equipped by the manufacturer with idle adjustment limiters had to have been delivered to the facility with these limiters removed or otherwise rendered ineffective. Up to one-hundred qualified vehicles were involved in the evaluation at each site.

Subsequent to the as-received tests and the vehicle inspection procedure which followed, vehicles qualifying for the evaluation were subjected to propane enrichment. The number of turns each mixture adjusting screw was set rich or lean, as the case may have been, was recorded. Each screw was returned to its original position following this action. Idle speed with the screws (or screw) in their original position was also recorded. Following this, the vehicle was taken to a local repair facility accompanied by the statement that the vehicle was not idling satisfactorily and the request that idle speed

and mixture be adjusted to manufacturer's specifications. At times the request was handled immediately. At other times the vehicle had to be left at the facility and picked up later. A certain amount of precaution, although far from extreme, was taken to ensure that the vehicle's appearance at the facility had nothing to do with the unusual.

Upon return of the vehicle from the facility, propane enrichment was repeated and as-returned mixture screw settings and idle speed were recorded. Idle speed and mixture were subsequently set to manufacturer's specifications, if repair facility action had not produced such settings, limiters were installed and the vehicle was returned to its owner.

Some follow-up inspections to determine status of the installed limiters were made in the subsequent period.

2.6.16 Dealer/Non-dealer Idle Adjustment Evaluation Procedure

This procedure is an extension of the idle adjustment evaluation procedure described above. It applies only to the Houston testing site.

Vehicles involved in this evaluation were divided into two model-year groups: those which passed predetermined emission standards and those which failed. Passage or failure was based on emission levels measured during the closed throttle, neutral idle mode of the Two Speed Idle Test. The standards were 200 ppm C_6 (n-hexane) and 1.0% CO. Vehicles in each model-year group were alternately sent to new car dealers and non-dealers based solely on the order in which they appeared (eg, the first 1978 model which passed was sent to a dealer; the second was sent to a non-dealer, etc). The explanation and instructions which accompanied the vehicle's arrival at the facility are the same as those given in the idle adjustment evaluation referenced above. Although a particular facility was used more than one time, the passage of several days intervened.

The as-received vehicle test sequence was repeated subsequent to the repair facility action.

2.6.17 Daily Test Schedule Procedure

Overall program scheduling was dictated by personnel, equipment and facility

availability and the time constraint of the contract. These factors, as well as individual site workload requirements, dictated the daily testing rates.

Tests were performed on a three shift per day, six day per week basis in Los Angeles, Houston, Phoenix and Washington, D.C. Work shifts for the most part began at 7:00 AM, 3:00 PM and 11:00 PM. Tests were not generally scheduled between the hours of 4:00 PM and 7:00 PM. Daily equipment quality assurance checks were performed during this period. Some weekly and bi-weekly equipment calibrations and checks were also performed during this period, as well as during unscheduled breaks in the testing schedule. Most weekly and bi-weekly calibration activities were performed on the one day of the week when tests were not scheduled. Equipment maintenance was also performed in these periods.

Tests in St. Louis and Denver were conducted on a two shift per day, five day per week basis. Shifts began at 8:00 AM and 5:00 PM. Daily equipment quality assurance and maintenance activities took place outside of the testing schedule.

Vehicle acceptance activities generally took place at all sites between the morning hours of 7:00 - 9:00 and the evening hours of 5:00 - 7:00 as a convenience to participants.

Vehicle throughput varied widely from site to site and within each site due to variations in vehicle testing, inspection and maintenance requirements.

2.7 DATA HANDLING

2.7.1 Data Collection

Many parameters directly associated with the emission tests were recorded on strip charts. Included were: temperature of the soak area, wet and dry bulb temperatures of air supplied to the vehicle under test, temperature of the CVS dilution air/exhaust gas mixing point and the output of each emission analyzer. Barometric pressure was recorded on a seven-day circular chart. Recorders monitoring emission analyzer outputs were allowed to run continuously during calibration and emission analysis. An on-line mini-computer was used to integrate analyzer readings during diluted and undiluted

emission analysis and as a cross check to verify analyzer deflections and ranges in use. Other test data were manually collected and recorded.

2.7.2 Data Processing

After an on-site review, raw data in the form of individual test packets were shipped from the testing sites to the data processing center in Denver for final review and disposition. Processing of the raw data was performed manually and by computer. A large scale time-sharing system was used to perform the computerized part of processing operations. Manual processing consisted of combining data from the raw data sheets with magnetic tape-contained data from the on-line computer into a single tape. Once combined, these data were transferred to the time-share system where they were subjected to additional manual and computerized review and edit operations. Corrections to the computer contained data files were made as necessary. The corrected data were subsequently computer reduced, output and reported on a monthly basis.

2.7.3 Quality Control

Quality of the test data was assured through reviews and edits which were conducted at several stages in the collection and subsequent handling processes.

The first of two reviews was conducted at the testing site. Subsequent to completion of each test sequence all data were collected and assembled into a single test packet. Materials in the test packet included: data sheets used to identify the vehicle, vehicle exchange agreements, the completed vehicle-owner questionnaire, raw data sheets associated with each test in the sequence, analyzer strip-chart recordings and on-line computer magnetic tape print-outs, cooling air temperature and humidity recordings for each test in the sequence, tank heat-build and SHED internal temperature strip-chart recordings and data sheets used to document vehicle preparation procedures and inspection results. Upon assembly, each of these materials was reviewed for completeness and accuracy. This review was started as soon after test sequence completion as practicable in an effort to have it completed before the vehicle started into another

testing sequence or was returned to its owner. The practice of early review was employed for two reasons: to keep the necessity for vehicle recall and retest to a minimum and to facilitate immediate feedback to test personnel of errors and omissions as they emerged. Following this part of the quality assurance program the test packets were shipped to Denver.

Soak area temperature traces, raw data sheets and strip-chart recordings used to document periodic calibrations and checks of the test equipment and other materials common to tests on a group of vehicles were subjected to a similar review, packaged and also sent to Denver.

Upon arrival in Denver, each packet was reviewed a second time for completeness and accuracy. Following this review data from the raw data sheets were manually combined with magnetic tape contained data from the on-line computer and a single magnetic tape was produced. Data from this tape was subsequently placed into the time-share computer. Printed lists generated by the computer were proof-read against the original data. Corrections were made to the computer stored data as necessary.

A computerized edit program was applied to the stored data after the more obvious errors had been corrected and data files were complete. This edit program examines each data entry for keying errors and for logical and tolerance deviations from established criteria. Errors determined in connection with this process were resolved by one or more of a number of means including communication with on-site testing personnel, more detailed reviews of test documentation and, as necessary, by recall and reinspection or retesting of the vehicle in question.

A "dump" sheet containing the reduced data was subsequently produced. Each entry on the dump sheet was checked for reasonableness and accuracy. Reasonableness was established on the basis of one data point relative to another, a single data point relative to a composite of data points and both single and composite data points relative

to the weight, engine size, model year, maintenance state and other pertinent characteristics of the vehicle.

Errors found in the course of on-site reviews were usually associated with inconsistencies between materials in the test packet (eg, information on the vehicle-owner questionnaire conflicted with that of the after-test vehicle inspection) and errors in transposing data from strip charts to raw data sheets (eg, analyzer ranges and deflections). Problems dealt with in subsequent stages of review were most frequently associated with insufficient verbal information backing up numerical emission component failure and vehicle maintenance action codes and inconsistencies in responses within the vehicle-owner questionnaire.

2.7.4 Calculation of Results

Results for the mass emission tests (i.e., those employing the CVS) were calculated by means of the formulae of 40 Federal Register 126. Although actual distances traveled by the test vehicle were measured in connection with the tests, these distances were not used in the calculations. Distance constants of the 40 Federal Register 126 exhaust emission test (FTP) driving schedule and distance constants of other of the mass emission tests were respectively used, instead. The equations of 40 Federal Register 126 applied to the following tests:

Federal Exhaust Emission Test (FTP)

Highway Fuel Economy Test

New York City Cycle Test

Federal Short Cycle Tests

The carbon balance equations of 42 Federal Register 176 which take mass HC, CO and CO₂ emissions into account were used to calculate fuel economy data for the above tests. The distance constants associated with each test were respectively used for fuel economy calculations, as well.

Results for the Evaporative Emission Tests were calculated using the equations of
41 Federal Register 164.

Volumetric test results are reported as measured. Volumetric results applied to the
following tests:

50 Cruise test

Two Speed Idle Test

Federal Three Mode Test

Loaded Two Mode Test

Four Speed Idle Test

3. SUMMARY OF VEHICLE CHARACTERISTICS AND TEST RESULTS

Characteristics of the vehicle samples, summary FTP exhaust emission results and data on vehicles in relation to the Federal Exhaust Emission Standards are presented on a site by site basis in Tables 1 through 6 as follows:

Table 1 - Test sample quantities by vehicle model-year and make.

Table 2 - Test sample quantities by model-year and each of: mileage interval, inertia weight, engine displacement and number of engine cylinders.

Table 3 - Arithmetic mean FTP emission results and harmonic mean FTP and HFET fuel economy results by model-year.

Table 4 - Quantities and rates of 1975 through 1980 model-year vehicles meeting Federal Exhaust Emission Standards.

Table 5 - Quantities and rates of 1979 model-year vehicle makes meeting Federal Exhaust Emission Standards.

Table 6 - Quantities and rates of 1980 model-year vehicle makes meeting Federal Exhaust Emission Standards.

4. ACKNOWLEDGEMENTS

Mr. Thomas Bejma, the EPA's Project Officer, is acknowledged for his able guidance and assistance.

Mssrs. John Shelton, Thomas Tupaj and other EPA staff members are acknowledged for their assistance in site start-up operations.

APPENDIX A - LISTING OF VEHICLES AND TEST PARAMETERS

Legend

VEH. NO. - Vehicle number

YR - Model year

MAKE - Vehicle make

MODL - Vehicle model

CID - Engine displacement in cubic inches

CYL - Number of cylinders

BBL - Number of carburetor venturis (F: fuel injection)

T - Type of transmission (A: automatic; 2: semi-automatic;
3: 3-speed manual; 4: 4-speed manual; 5: 5-speed manual)

ENGINE FAMILY - Engine family

AC - Vehicle equipped with air conditioning: (Y: yes; N: no)

FT - Fuel tank capacity in gallons

I.WT - Dynamometer inertia weight setting for Federal Test
Procedure (if applicable)

A.HP - Actual road load horsepower setting for Federal Test
Procedure (if applicable)

ACL - Was 10% AHP added to simulate air conditioner: (Y: yes;
N: no; M: manufacturer's certification AHP setting)

TEST NO. - Contractor run number

TEST DATE - Date of test (month/day/year)

IRPM - Idle RPM

TME - Ignition timing in degrees (+ indicates before top dead center;
- indicates after top dead center; 000 indicates top dead center)

DB - Dry bulb temperature (degrees Fahrenheit)

WB - Wet bulb temperature (degrees Fahrenheit)

BARO. - Barometric pressure (inches Hg)

The engine and test parameters were obtained as indicated by the following designations:

- A) SPEC - Manufacturer's specifications
- B) BASE - Measured as-received from vehicle owner with indolene fuel.
- C) EXT2 - Los Angeles: Measured after the extended vehicle emission control system enablement and adjustment procedure, idle speed and mixture adjustment procedure, and obvious maladjustment corrections.

Other sites: Measured after the extended vehicle emission control system enablement and adjustment procedure.

- D) EXT3 - Los Angeles: Measured after the extended vehicle oxygen sensor replacement procedure.

Other sites: Measured after the extended vehicle idle speed and mixture adjustment procedure.

- E) EXT4 - Los Angeles: Measured after the extended vehicle maladjustment and disablement adjustment procedure.

Other sites: Measured after the extended vehicle emission components repair and major tune-up procedure.

- F) EXT5 - Los Angeles: Measured after the extended vehicle emission components repair and major tune-up procedure.

Other sites: Not applicable

- G) EXT6 Houston: Measured after the extended vehicle idle mixture and RPM adjustment at a commercial facility.

Other sites: Not applicable

651 CHAMBERS ROAD, SUITE # 200
AURORA, COLORADO 80011

APPENDIX B - LISTING OF VEHICLE USAGE DATA

Legend

- VEH. NO. - Vehicle number
- YR - Model year
- MAKE - Vehicle make
- MODL - Vehicle model
- ODOMETER - True mileage
- N - Purchased new or used (1: new; 2: used)
- PUR - Purchase date of vehicle (1: 0-3 mos; 2: 3-12 mos;
3: 1-2 yrs; 4: over 2 yrs ago)
- YMT - Yearly vehicle miles traveled (1: 0-5000; 2: 5001-10,000;
3: 10,001-15,000; 4: 15,001-20,000; 5: 20,001-30,000;
6: over 30,000)
- DRIVING WHERE - Where driving is done (1: almost all; 2: most; 3: some;
4: little or none)
F: City expressway
C: Major city street
O: Other city street
I: Rural expressway
R: Other rural road
- DRIVING HOW - How driving is done (1: almost all; 2: most; 3: some;
4: little or none)
W: To and from work driving
S: Shopping and errands
B: Business
V: Other driving, vacations, social, etc.
- L - Trip to the test lab (1: city streets only; 2: some
expressways; 3: primarily expressways)
- MI - Approximate miles traveled to lab
- VEHUSE - Vehicle use (1: almost all; 2: most; 3: some; 4: little
or none)
A: Driver only
B: Driver and one passenger
C: Driver and two or more passengers
D: Driver only with heavy cargo
E: Driver, passenger, and cargo
F: Towing a trailer

- TR - Number of trips made on a typical day
- F - How often is full throttle acceleration used per week
(1: seldom; 2: once or twice; 3: 3-6 times; 4: every day)
- OA - Overall fuel economy (0: don't know)
- HD - Highway fuel economy (0: don't know)
- CD - City driving fuel economy (0: don't know)
- H - Hydrogen Sulfide odor in exhaust (1: never; 2: seldom;
3: occasionally; 4: frequently; 5: don't know)
- U - Vehicle operated regularly on unpaved roads, in competitive
events, or in transporting loads heavier than for which it
was designed (1: yes; 2: no; 3: don't know)
- DAMAGE - Major damage in any of the following areas (1: yes; 2: no)
- A: Engine
 - B: Cooling System
 - C: Fuel System
 - D: Exhaust System
 - E: No Damage
 - F: Don't Know

APPENDIX C - LISTING OF VEHICLE MAINTENANCE DATA

Legend

VEH. NO. - Vehicle number

YR - Model year

MAKE - Vehicle make

MODL - Vehicle model

VIN - Vehicle Identification Number

PERFORM - Any engine performance problems (1: yes; 2: no)

- A: Hard starting
- B: Stalling
- C: Rough idle
- D: Engine misfiring
- E: Poor acceleration
- F: Stumbling
- G: Hesitation
- H: Engine knock or ping
- I: Dieseling (after-run)

S - Reasonably satisfied with engine performance (1: yes;
2: most of the time; 3: no)

O - How long ago was the last oil change (1: too new not due;
2: due but not yet done; 3: 0-6 mos; 4: 6-12 mos;
5: over 1 yr; 6: don't know)

T - How often is vehicle tuned-up (1: no tune-up yet; 2: per
mfrs recommendation; 3: every 6 mos; 4: every year; 5: less
often; 6: don't know)

L - How long ago was the last tune-up (1: too new not due;
2: due but not yet done; 3: 0-6 mos; 4: 6-12 mos;
5: over 1 yr; 6: don't know)

U - Who performed this tune-up (1: no tune-up; 2: dealer;
3: independent garage; 4: tune-up clinic; 5: yourself
6: don't know)

C - Approximately how much did the tune-up cost (dollars or
-1: warranty; 0: no tune-up yet; 1: don't know)

R - Would you consider the vehicle has been maintained in
accordance with the manufacturer's recommendations
(1: yes; 2: no; 3: not sure; 4: don't know)

- W - How many times has this vehicle been returned for warranty repairs (1: no warranty; 2: never returned; 3: once; 4: twice; 5: 3 or more; 6: don't know)
- F - What was the nature of the warranty repair (1: no warranty; 2: never returned; 3: recall; 4: driveability; 5: other)
- D - Have you had any repairs to your vehicle for the correction of driveability problems (1: yes; 2: no problems)
- B - What repairs were performed on your vehicle to correct the driveability problems (1: none; 2: carburetor; 3: engine; 4: emission control system; 5: ignition system; 6: other; 7: don't know)
- P - How long ago were these repairs accomplished (1: no repairs; 2: 0-3 months; 3: 3-6 months; 4: over 6 months; 5: don't know)
- E - Were these repairs effective in correcting the driveability problems (1: no repairs; 2: yes; 3: no)
- V - Does your vehicle require the use of unleaded fuel (1: yes; 2: no)
- N - If your vehicle requires unleaded fuel how often is leaded fuel used (1: not required; 2: never; 3: seldom; 4: occasionally; 5: frequently; 6: don't know)
- Pb - Lead content of owners fuel (grams per gallon, OS indicates any content greater than .1000 grams per gallon; NA indicates not applicable as leaded fuel is used).
- FUEL - Brand name of fuel normally used
- X - What is the type of fuel you normally use (1: regular; 2: premium; 3: low lead; 4: regular unleaded; 5: premium unleaded; 6: unknown; 7: varies)
- M - Has this vehicle ever been modified by the installation of high performance equipment (Y: yes; N: no)

APPENDIX D - LISTING OF VEHICLE MAINTENANCE HISTORY

Legend

- VEH. NO. - Vehicle number
- MODL YEAR - Model year
- MAKE - Vehicle make
- MODL - Vehicle model
- LYV - Vehicle tested in last year program (1: yes; 2: no)
- LYN - Last year's vehicle number
- M - Maintenance performed since last year (1: yes; 2: no; 3: not tested)
- T - Type of maintenance performed (1: warranty; 2: tune-up; 3: none; 4: not tested)
- C - Cost of maintenance (\$ or 1: no maintenance; 2: don't know; 3: not tested)
- P - Facility type for maintenance performed (1: no maintenance; 2: dealer; 3: independent garage; 4: tune-up clinic; 5: yourself; 6: not tested)
- CAT - Has the catalytic converter ever been replaced on this vehicle (1: no catalyst; 2: yes; 3: no; 4: don't know)
- FE - Do you accurately keep records of the fuel economy on this vehicle (1: yes; 2: no)
- CF - Are you concerned with the fuel economy of this vehicle (1: yes; 2: no)
- CI - Date of last city inspection (MMYY; 9999: don't know; 0000: never inspected; 9898: not required)
- P - Did the vehicle pass or fail the inspection (1: pass; 2: fail; 3: don't know; 4: not required; 5: never inspected)

APPENDIX E - LISTING OF FEDERAL TEST PROCEDURE
RESULTS ON INDIVIDUAL VEHICLES

Legend

- VEH. NO. - Vehicle number
- MODL YEAR - Model year
- MAKE - Vehicle make
- MODL - Vehicle model
- CID - Engine displacement in cubic inches
- TEST TYPE - Indicates the portion of the test or composite
- COLD TRANS - Cold transient portion of test
- COLD STABI - Cold stabilized portion of test
- HOT TRANS - Hot transient portion of test
- 75 FTP - 1975 Federal Test Procedure composite
- BASE - Measured as-received from vehicle owner with indolene fuel
- EXT2 - Los Angeles: Measured after the extended vehicle emission control system enablement and adjustment procedure, idle speed and mixture adjustment procedure, and obvious maladjustment corrections.
Other sites: Measured after the extended vehicle emission control system enablement and adjustment procedure.
- EXT3 - Los Angeles: Measured after the extended vehicle oxygen sensor replacement procedure.
Other sites: Measured after the extended vehicle idle speed and mixture adjustment procedure.
- EXT4 - Los Angeles: Measured after the extended vehicle maladjustment and disablement adjustment procedure.
Other sites: Measured after the extended vehicle emission components repair and major tune-up procedure.
- EXT5 - Los Angeles: Measured after the extended vehicle emission components repair and major tune-up procedure.
Other sites: Not applicable
- EXT6 - Houston: Measured after the extended vehicle idle mixture and RPM adjustment at a commercial facility.
Other sites: Not applicable
- COMMENT - For each vehicle subjected to the Extended Testing Procedure, the test data will be followed by a short comment relating to the status of the engine and maintenance performed

EMISSION RESULTS

(gm/mi) - Emission results measured in grams per mile

HC - Hydrocarbon emissions in grams per mile

CO - Carbon monoxide emissions in grams per mile

CO₂ - Carbon dioxide emissions in grams per mile

NO_{xc} - Oxides of nitrogen emission corrected for humidity in grams per mile

FUEL ECON MPG - Fuel Economy calculated by the carbon balance method in miles per gallon

IHC - Hydrocarbon concentration with vehicle at normal idle, measured with garage-type instrumentation in parts per million hexane equivalent

ICO (act) - Carbon monoxide concentration with vehicle at normal idle, measured with garage-type instrumentation in mole per cent

ICO (spec) - Carbon monoxide concentration with vehicle at normal idle, as specified by the manufacturer (N/A: no specifications available).

OTHER TESTS - Lists other emission factors tests conducted on the vehicle

HFET - Vehicle was used in Highway Fuel Economy test

EVAP - Vehicle was used in the Evaporative Emissions Test Program

SHORT TESTS - Vehicle was used in the series of Short Tests

50 CRUISE - Vehicle was used in the 50 Cruise test

NEW YORK - Vehicle was used in the New York City Cycle Test

IDLE MIX - Vehicle was used in the commercial Facility Idle Adjustment Evaluation Program

APPENDIX F - LISTING OF EVAPORATIVE EMISSION
RESULTS ON INDIVIDUAL VEHICLES

Legend

VEH. NO. - Vehicle number

MODL YEAR - Model year

MAKE - Vehicle make

MODL - Vehicle model

CID - Engine displacement in cubic inches

EVAPORATIVE
EMISSIONS - Evaporative emissions (gms)

DIURNAL - Evaporative emissions measured during diurnal phase of
test in grams

HOT SOAK - Evaporative emissions measured during hot soak portion of test
in grams

TOTAL - Sum of emissions measured during diurnal and hot soak test
in grams

APPENDIX G - LISTING OF 50 CRUISE
ON INDIVIDUAL VEHICLES

Legend

VEH. NO - Vehicle number

MAKE - Vehicle make

MODL - Vehicle model

CID - Engine displacement in cubic inches

RLHP - Dynamometer road load horsepower used in test

HC (PPM) - Exhaust hydrocarbon concentration in ppm hexane

CO% - Exhaust carbon monoxide concentration in mole percent

NO (PPM) - Exhaust oxides of nitrogen concentration in ppm

APPENDIX H - LISTING OF HIGHWAY FUEL ECONOMY AND EMISSION
RESULTS ON INDIVIDUAL VEHICLES

Legend

VEH. NO. - Vehicle number

MODL YEAR - Model year

MAKE - Vehicle make

MODL - Vehicle model

CID - Engine displacement in cubic inches

SEQ. - Test sequence

- A) BASE - Measured as-received from vehicle owner with indolene fuel
- B) EXT2 - Los Angeles: Measured after the extended vehicle emission control system enablement and adjustment procedure, idle speed and mixture adjustment procedure, and obvious maladjustment corrections.
Other sites: Measured after the extended vehicle emission control system enablement and adjustment procedure.
- C) EXT3 - Los Angeles: Measured after the extended vehicle oxygen sensor replacement procedure.
Other sites: Measured after the extended vehicle idle speed and mixture adjustment procedure.
- D) EXT4 - Los Angeles: Measured after the extended vehicle maladjustment and disablement adjustment procedure.
Other sites: Measured after the extended vehicle emission components repair and major tune-up procedure.
- E) EXT5 - Los Angeles: Measured after the extended vehicle emission components repair and major tune-up procedure.
Other sites: Not applicable
- F) EXT6 - Houston: Measured after the extended vehicle idle mixture and RPM adjustment at a commercial facility.
Other sites: Not applicable

EMISSION RESULTS

(gm/mi) - Emission results measured in grams per mile

HC - Hydrocarbon emission in grams per mile

CO - Carbon Monoxide emissions in grams per mile

CO_2 - Carbon Dioxide emissions in grams per mile

NO_{xc} - Oxides of Nitrogen emissions corrected for humidity in grams per mile

FUEL ECON MPG - Fuel economy in miles per gallon, calculated using the carbon balance method
